

Usage

The JXR Plugin generates a cross-reference of the project's sources. Below are the different goals and configurations for the plugin.

➔ Generate JXR as Part of Project Reports

To include the JXR report in the site generation process, insert the following in the `<reporting>` section of your `pom.xml`:

```
<project>
  ...
  <build>
    ...
  </build>
  <reporting>
    <plugins>
      <plugin>
        <groupId>org.apache.maven.plugins</groupId>
        <artifactId>maven-jxr-plugin</artifactId>
        <version>2.5</version>
      </plugin>
    </plugins>
  </reporting>
  ...
</project>
```

The report will be generated when you execute:

```
mvn site
```

➔ Explicitly Generate JXR Files

The JXR files for the project's main sources will be generated using this command:

```
mvn jxr:jxr
```

To generate JXR files for the project's test sources, execute this command:

```
mvn jxr:test-jxr
```
